Problem Set #8

Econ 103

Part I – Problems from the Textbook

No problems from the textbook on this assignment.

Part II – Additional Problems

- 1. For this question assume that we have a random sample from a normal distribution with unknown mean but known variance.
 - (a) Suppose that we have 36 observations, the sample mean is 5, and the population variance is 9. Construct a 95% confidence interval for the population mean.
 - (b) Repeat the preceding with a population variance of 25 rather than 9.
 - (c) Repeat the preceding with a sample size of 25 rather than 36.
 - (d) Repeat the preceding but construct a 50% rather than 95% confidence interval.
 - (e) Repeat the preceding but construct a 99% rather than a 50% confidence interval.
- 2. In this question you will carry out a simulation exercise similar to the one I used to make the plot of twenty confidence intervals from lecture 16.
 - (a) Write a function called my.CI that calculates a confidence interval for the mean of a normal population when the population standard deviation is known. It should take three arguments: data is a vector containing the observed data from which we will calculate the sample mean, pop.sd is the population standard deviation, and alpha controls the confidence level (e.g. alpha = 0.1 for a 90% confidence interval). Your function should return a vector whose first element is the lower confidence limit and whose second element is the upper confidence limit. Test out your function on a simple example to make sure it's working properly.
 - (b) Write a function called CI.sim that takes a single argument sample.size. Your function should carry out the following steps. First generate sample.size draws from a standard normal distribution. Second, pass your sample of standard normals to my.CI with alpha set to 0.05 and pop.sd set to 1. Third, return the resulting

confidence interval. Test your function on a sample of size 10. (What we're doing here is constructing a 95% confidence interval for the mean of a normal population using simulated data. The population mean is in fact zero, but we want to see how our confidence interval procedure works. To do this we "pretend" that we don't know the population mean and only know the population variance. Think about this carefully and make sure you understand the intuition.)

- (c) Use replicate to construct 10000 confidence intervals based on simulated data using the function CI.sim with sample.size equal to 10. (Note that replicate will, in this case, return a matrix with 2 rows and 10000 columns. Each column correponds to one of the simulated confidence intervals. The first row contains the lower confidence limit while the second row contains the upper confidence limit.) Calculate the proportion of the resulting confidence intervals contain the true population mean. Did you get the answer you were expecting?
- (d) Repeat the preceding but rather than using CI.sim write a new function called CI.sim2. This new function should be identical to CI.sim except that, when calling my.CI, it sets pop.sd = 1/2 rather than 1. How do your results change? Try to provide some intuition for any differences you find.
