### Economics 103 – Statistics for Economists

Francis J. DiTraglia

University of Pennsylvania

Lecture 22

#### Last Time

Walked through steps of hypothesis testing in a simple example.

### Today

- Relationship between hypothesis testing and Cls
- ► More examples of hypothesis tests

### Relationship between CI and Two-Sided Test

- There is a very close relationship between CIs and hypothesis tests against a two-sided alternative.
- I'll illustrate this using a generic version of the example from last class but the relationship holds in general.

# Relationship between CI and Two-sided Test

Suppose  $X_1, \ldots, X_n \sim \mathsf{iid}\ \mathit{N}(\mu, \sigma^2)$ 

Test  $H_0$ :  $\mu = \mu_0$  vs.  $H_1$ :  $\mu \neq \mu_0$  at significance level  $\alpha$ 

- ▶ Test Statistic:  $T_n = \sqrt{n}(\bar{X}_n \mu_0)/S \sim t(n-1)$  under  $H_0$
- ▶ Decision Rule: Reject  $H_0$  if  $|T_n| > qt(1 \alpha/2, df = n 1)$

$$100 \times (1 - \alpha)\%$$
 CI for  $\mu$ 

$$\bar{X}_n \pm \operatorname{qt}(1-\alpha/2,\operatorname{df}=n-1)\frac{S}{\sqrt{n}}$$

## Relationship between CI and Two-sided Test

$$c = \operatorname{qt}(1 - \alpha/2, \operatorname{df} = n - 1)$$

Decision Rule: Reject  $H_0$  if

$$\left|\frac{\bar{X}_n - \mu_0}{S/\sqrt{n}}\right| > c \quad \iff \quad \left(\frac{\bar{X}_n - \mu_0}{S/\sqrt{n}} > c \quad \mathsf{OR} \quad \frac{\bar{X}_n - \mu_0}{S/\sqrt{n}} < -c\right)$$

Equivalent to: Don't Reject H<sub>0</sub> provided

$$-c \le \frac{\bar{X}_n - \mu_0}{S/\sqrt{n}} \le c$$

$$\bar{X}_n - c \times \frac{S}{\sqrt{n}} \le \mu_0 \le \bar{X}_n + c \times \frac{S}{\sqrt{n}}$$

### What does this mean?

### Two-sided Test $\iff$ Checking if $\mu_0 \in CI$

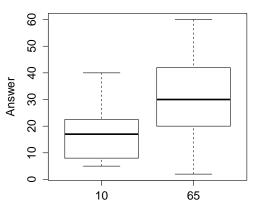

A two-sided test of  $H_0$ :  $\mu=\mu_0$  against  $H_1$ :  $\mu\neq\mu_0$  at significance level  $\alpha$  is equivalent to checking whether  $\mu_0$  lies inside the corresponding  $100\times(1-\alpha)\%$  confidence interval for  $\mu$ .

### "Inverting" Two-sided Test to get a CI

Collect all the values  $\mu_0$  such that we cannot reject  $H_0$ :  $\mu=\mu_0$  against the two-sided alternative. The result is *precisely* a  $100 \times (1-\alpha)\%$  CI for  $\mu$ .

# The Anchoring Experiment

### The Anchoring Experiment

Shown a "random" number and then asked what proportion of UN member states are located in Africa.

"Hi" Group – Shown 65 (
$$n_{Hi} = 46$$
)

Sample Mean: 30.7, Sample Variance: 253

"Lo" Group – Shown 10 (
$$n_{Lo} = 43$$
)

Sample Mean: 17.1, Sample Variance: 86

Fairly large samples here, so we'll proceed via the CLT...

### In words, what is our null hypothesis?

- (a) There is a *positive* anchoring effect: seeing a higher random number makes people report a higher answer.
- (b) There is a *negative* anchoring effect: seeing a lower random number makes people report a lower answer.
- (c) There is an anchoring effect: it could be positive or negative.
- (d) There is no anchoring effect: people aren't influenced by seeing a random number before answering.

# In symbols, what is our null hypothesis?

- (a)  $\mu_{Lo} < \mu_{Hi}$
- (b)  $\mu_{Lo} = \mu_{Hi}$
- (c)  $\mu_{Lo} > \mu_{Hi}$
- (d)  $\mu_{Lo} \neq \mu_{Hi}$

 $\mu_{Lo} = \mu_{Hi}$  is equivalent to  $\mu_{Hi} - \mu_{Lo} = 0!$ 

## **Anchoring Experiment**

Under the null, what should we expect to be true about the values taken on by  $\bar{X}_{Lo}$  and  $\bar{X}_{Hi}$ ?

- (a) They should be similar in value.
- (b)  $\bar{X}_{Lo}$  should be the smaller of the two.
- (c)  $\bar{X}_{Hi}$  should be the smaller of the two.
- (d) They should be different. We don't know which will be larger.

#### What is our Test Statistic?

### Sampling Distribution

$$\frac{\left(\bar{X}_{\textit{H}i} - \bar{X}_{\textit{Lo}}\right) - \left(\mu_{\textit{H}i} - \mu_{\textit{Lo}}\right)}{\sqrt{\frac{S_{\textit{H}i}^2}{n_{\textit{H}i}} + \frac{S_{\textit{Lo}}^2}{n_{\textit{Lo}}}}} \approx \textit{N}(0, 1)$$

Test Statistic: Impose the Null

Under 
$$H_0$$
:  $\mu_{Lo} = \mu_{Hi}$  
$$T_n = \frac{\bar{X}_{Hi} - \bar{X}_{Lo}}{\sqrt{\frac{\bar{S}_{Hi}^2}{n_{Hi}} + \frac{\bar{S}_{Lo}^2}{n_{Lo}}}} \approx N(0, 1)$$

### What is our Test Statistic?

$$\bar{X}_{Hi} = 30.7, \ s_{Hi}^2 = 253, \ n_{Hi} = 46$$
  
 $\bar{X}_{Lo} = 17.1, \ s_{Lo}^2 = 86, \ n_{Lo} = 43$ 

Under  $H_0$ :  $\mu_{Lo} = \mu_{Hi}$ 

$$T_n = rac{ar{X}_{Hi} - ar{X}_{Lo}}{\sqrt{rac{S_{Hi}^2}{n_{Hi}} + rac{S_{Lo}^2}{n_{Lo}}}} pprox N(0,1)$$

### Plugging in Our Data

$$T_n = rac{ar{X}_{Hi} - ar{X}_{Lo}}{\sqrt{rac{S_{Hi}^2}{n_{Hi}} + rac{S_{Lo}^2}{n_{Lo}}}} \approx 5$$

# Anchoring Experiment Example

Approximately what critical value should we use to test  $H_0$ :  $\mu_{Lo} = \mu_{Hi}$  against the two-sided alternative at the 5% significance level?

$\alpha$	0.10	0.05	0.01
$\mathtt{qnorm}(1-lpha)$	1.28	1.64	2.33
$\mathtt{qnorm}(1-lpha/2)$			

... Approximately 2

# Anchoring Experiment Example

Which of these commands would give us the p-value of our test of  $H_0$ :  $\mu_{Lo} = \mu$  against  $H_1$ :  $\mu_{Lo} < \mu_{Hi}$  at significance level  $\alpha$ ?

- (a) qnorm(1  $\alpha$ )
- (b) qnorm(1  $\alpha/2$ )
- (c) 1 pnorm(5)
- (d) 2 \* (1 pnorm(5))

# P-values for $H_0$ : $\mu_{Lo} = \mu_{Hi}$

We plug in the value of the test statistic that we observed: 5

Against 
$$H_1$$
:  $\mu_{Lo} < \mu_{Hi}$   
1 - pnorm(5) < 0.0000

Against 
$$H_1$$
:  $\mu_{Lo} \neq \mu_{Hi}$ 

$$2 * (1 - pnorm(5)) < 0.0000$$

If the null is true (the two population means are equal) it would be extremely unlikely to observe a test statistic as large as this!

What should we conclude?

### Which Exam is Harder?

Student	Exam 1	Exam 2	Difference
1	57.1	60.7	3.6
:	:	:	:
71	78.6	82.9	4.3
Sample Mean:	79.6	81.4	1.8
Sample Var.	117	151	124
Sample Corr.	0.54		

Again, large sample size here so we'll use CLT.

# One-Sample Hypothesis Test Using Differences

Let  $D_i = X_i - Y_i$  be (Midterm 2 Score - Midterm 1 Score) for student i

### **Null Hypothesis**

 $\mathit{H}_{0}$ :  $\mu_{1}=\mu_{2}$ , i.e. both exams were of the same difficulty

#### Two-Sided Alternative

 $H_1$ :  $\mu_1 \neq \mu_2$ , i.e. one exam was harder than the other

#### One-Sided Alternative

 $H_1$ :  $\mu_2 > \mu_1$ , i.e. the second exam was easier

### **Decision Rules**

Let  $D_i = X_i - Y_i$  be (Midterm 2 Score - Midterm 1 Score) for student i

#### Test Statistic

$$\frac{\bar{D}_n}{\widehat{SE}(\bar{D}_n)} = \frac{1.8}{\sqrt{124/71}} \approx 1.36$$

#### Two-Sided Alternative

Reject  $H_0$ :  $\mu_1 = \mu_2$  in favor of  $H_1$ :  $\mu_1 \neq \mu_2$  if  $|\bar{D}_n|$  is sufficiently large.

#### One-Sided Alternative

Reject  $H_0$ :  $\mu_1 = \mu_2$  in favor of  $H_1$ :  $\mu_2 > \mu_1$  if  $\bar{D}_n$  is sufficiently large.

# Reject against *Two-sided* Alternative with $\alpha = 0.1$ ?

$$\frac{\bar{D}_n}{\widehat{SE}(\bar{D}_n)} = \frac{1.8}{\sqrt{124/71}} \approx 1.36$$

$\alpha$	0.10	0.05	0.01
$\mathtt{qnorm}(1-lpha)$	1.28	1.64	2.33
$\mathtt{qnorm}(\mathtt{1}-\alpha/\mathtt{2})$			

- (a) Reject
- (b) Fail to Reject
- (c) Not Sure

# Reject against *One-sided* Alternative with $\alpha = 0.1$ ?

$$\frac{\bar{D}_n}{\widehat{SE}(\bar{D}_n)} = \frac{1.8}{\sqrt{124/71}} \approx 1.36$$

$\alpha$	0.10	0.05	0.01
$\mathtt{qnorm}(1-lpha)$	1.28	1.64	2.33
$\mathtt{qnorm}(1-\alpha/2)$	1.64	1.96	2.58

- (a) Reject
- (b) Fail to Reject
- (c) Not Sure

## P-Values for the Test of $H_0$ : $\mu_1 = \mu_2$

$$\frac{\bar{D}_n}{\widehat{SE}(\bar{D}_n)} = \frac{1.8}{\sqrt{124/71}} \approx 1.36$$

One-Sided  $H_1$ :  $\mu_2 > \mu_1$ 

1 - pnorm(1.36) = pnorm(-1.36)  $\approx 0.09$ 

Two-Sided  $H_1$ :  $\mu_1 \neq \mu_2$ 

 $2 * (1 - pnorm(1.36)) = 2 * pnorm(-1.36) \approx 0.18$ 

### Tests for Proportions

#### Basic Idea

The population *can't be* normal (it's Bernoulli) so we use the CLT to get approximate sampling distributions (c.f. Lecture 18).

#### But there's a small twist!

Bernoulli RV only has a *single* unknown parameter  $\implies$  we know *more* about the population under  $H_0$  in a proportions problem than in the other testing examples we've examined...

For best results, always *fully* impose the null.

### Tests for Proportions: One-Sample Example

### From Pew Polling Data

54% of a random sample of 771 registered voters correctly identified 2012 presidential candidate Mitt Romney as Pro-Life.

### Sampling Model

$$X_1, \ldots, X_n \sim \text{iid Bernoulli}(p)$$

### Sample Statistic

Sample Proportion: 
$$\hat{p} = \frac{1}{n} \sum_{i=1}^{n} X_i$$

Suppose I wanted to test  $H_0$ : p = 0.5

# Tests for Proportions: One Sample Example

Under  $H_0$ : p = 0.5 what is the standard error of  $\hat{p}$ ?

- (a) 1
- (b)  $\sqrt{\widehat{p}(1-\widehat{p})/n}$
- (c)  $\sigma/\sqrt{n}$
- (d)  $1/(2\sqrt{n})$
- (e) p(1-p)

$$p = 0.5 \implies \sqrt{0.5(1 - 0.5)/n} = 1/(2\sqrt{n})$$

Under the null we know the SE! Don't have to estimate it!

# One-Sample Test for a Population Proportion

### Sampling Model

 $X_1, \ldots, X_n \sim \mathsf{iid} \; \mathsf{Bernoulli}(p)$ 

### **Null Hypothesis**

 $H_0$ :  $p = Known Constant <math>p_0$ 

#### Test Statistic

$$T_n = \frac{p - p_0}{\sqrt{p_0(1 - p_0)/n}} \approx N(0, 1)$$
 under  $H_0$  provided  $n$  is large

### One-Sample Example $H_0$ : p = 0.5

54% of a random sample of 771 registered voters knew Mitt Romney is Pro-Life.

$$T_n = \frac{\widehat{p} - p_0}{\sqrt{\frac{p_0(1 - p_0)}{n}}} = 2\sqrt{771}(0.54 - 0.5)$$
$$= 0.08 \times \sqrt{771} \approx 2.2$$

#### One-Sided p-value

1 - pnorm(2.2)  $\approx 0.014$ 

### Two-Sided p-value

 $2 * (1 - pnorm(2.2)) \approx 0.028$ 

### Tests for Proportions: Two-Sample Example

#### From Pew Polling Data

53% of a random sample of 238 Democrats correctly identified Mitt Romney as Pro-Life versus 61% of 239 Republicans.

### Sampling Model

Republicans:  $X_1, \ldots, X_n \sim \text{iid Bernoulli}(p)$  independent of

Democrats:  $Y_1, \ldots, Y_m \sim \mathsf{iid} \; \mathsf{Bernoulli}(q)$ 

### Sample Statistics

Sample Proportions: 
$$\hat{p} = \frac{1}{n} \sum_{i=1}^{n} X_i$$
,  $\hat{q} = \frac{1}{m} \sum_{i=1}^{m} Y_i$ 

Suppose I wanted to test  $H_0$ : p = q

### A More Efficient Estimator of the SE Under $H_0$

### Don't Forget!

Standard Error (SE) means "std. dev. of sampling distribution" so you should know how to prove that that:

$$SE(\widehat{p}-\widehat{q})=\sqrt{rac{p(1-p)}{n}+rac{q(1-q)}{m}}$$

Under  $H_0$ : p = q

Don't know values of p and q: only that they are equal.

### A More Efficient Estimator of the SE Under $H_0$

#### One Possible Estimate

$$\widehat{SE} = \sqrt{rac{\widehat{p}(1-\widehat{p})}{n} + rac{\widehat{q}(1-\widehat{q})}{m}}$$

#### A Better Estimate Under H<sub>0</sub>

$$\widehat{SE}_{Pooled} = \sqrt{\widehat{\pi}(1-\widehat{\pi})\left(\frac{1}{n} + \frac{1}{m}\right)}$$
 where  $\widehat{\pi} = \frac{n\widehat{p} + m\widehat{q}}{n+m}$ 

### Why Pool?

If p=q, the two populations are the same. This means we can get a more precise estimate of the common population proportion by pooling. More data = Lower Variance  $\implies$  better estimated SE.

### Two-Sample Test for Proportions

### Sampling Model

 $X_1, \ldots, X_n \sim \text{iid Bernoulli}(p) \text{ indep. of } Y_1, \ldots, Y_m \sim \text{iid Bernoulli}(q)$ 

### Sample Statistics

Sample Proportions: 
$$\hat{p} = \frac{1}{n} \sum_{i=1}^{n} X_i$$
,  $\hat{q} = \frac{1}{m} \sum_{i=1}^{m} Y_i$ 

#### Null Hypothesis

$$H_0: p = q \quad \Leftarrow \boxed{\text{i.e. } p - q = 0}$$

#### Pooled Estimator of SE under $H_0$

$$\widehat{\pi} = \frac{n\widehat{p} + m\widehat{q}}{n + m}, \quad \widehat{SE}_{Pooled} = \sqrt{\widehat{\pi}(1 - \widehat{\pi})(1/n + 1/m)}$$

#### Test Statistic

The extraction 
$$T_n = \frac{\widehat{p} - \widehat{q}}{\widehat{SE}_{Pooled}} \approx N(0, 1)$$
 under  $H_0$  provided  $n$  and  $m$  are large

### Two-Sample Example $H_0$ : p = q

53% of 238 Democrats knew Romney is Pro-Life vs. 61% of 239 Republicans

$$\widehat{\pi} = \frac{n\widehat{p} + m\widehat{q}}{n + m} = \frac{239 \times 0.61 + 238 \times 0.53}{239 + 238} \approx 0.57$$

$$\widehat{SE}_{Pooled} = \sqrt{\widehat{\pi}(1-\widehat{\pi})(1/n+1/m)} = \sqrt{0.57 \times 0.63(1/239+1/238)}$$

$$\approx 0.054$$

$$T_n = \frac{\widehat{p} - \widehat{q}}{\widehat{SE}_{Pooled}} = \frac{0.61 - 0.53}{0.054} \approx 1.48$$

#### One-Sided P-Value

1 - pnorm(1.48)  $\approx 0.07$ 

#### Two-Sided P-Value

 $2 * (1 - pnorm(1.48)) \approx 0.14$
